Agenda

- Review of Software-based Storage
- Container Schedulers
- Schedulers + Software-based Storage = Awesome!
- To the Cloud!!
- Demo

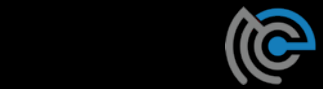
Software-based Storage

What are they?

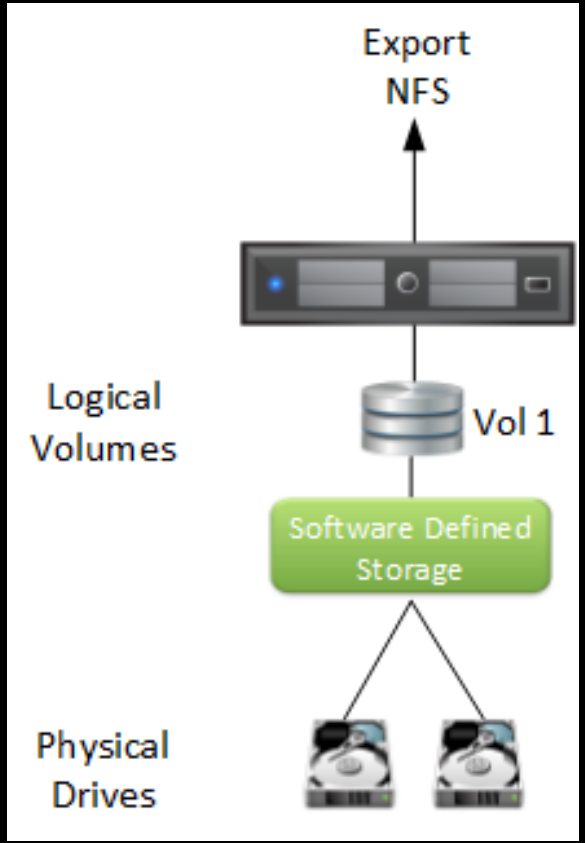
- Many definitions… most agree on:
- Software-Defined Storage (SDS) serve as abstraction layer above underlying storage
- Provides a (programmatic) mechanism to provision storage
- Varying degrees of SDS: NFS, VMware VSAN

What makes them unique?

- Operational - Manage provisioning process and data independent of underlying hardware
- Physical - Abstract consumed logical storage from underlying physical storage
- Policy - Automation of policy driven both external (users) and internal (platform)
- Day 2 Operations - Maintenance is inherently different

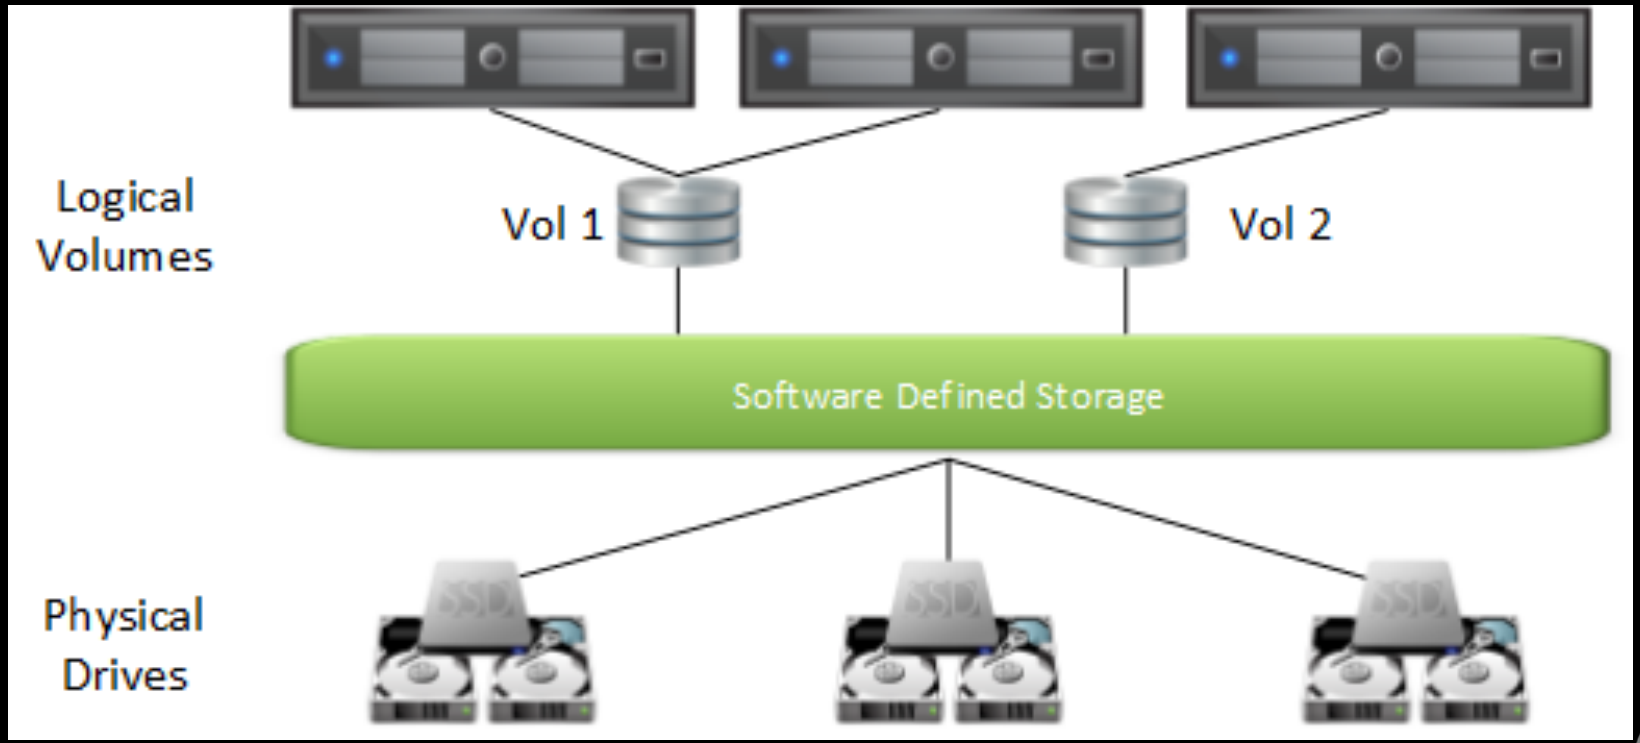


Example: NFS



Export
NFS
Logical
Volumes
Vol 1
Software Defined
Storage
Physical
Drives

Example: VSAN



NFS & VSAN are different…

- What makes NFS and VSAN special?
- They are both Software-based Storage Platforms!
- No special hardware, purpose built appliance, storage array, storage controller

Container Schedulers

What is a Scheduler?

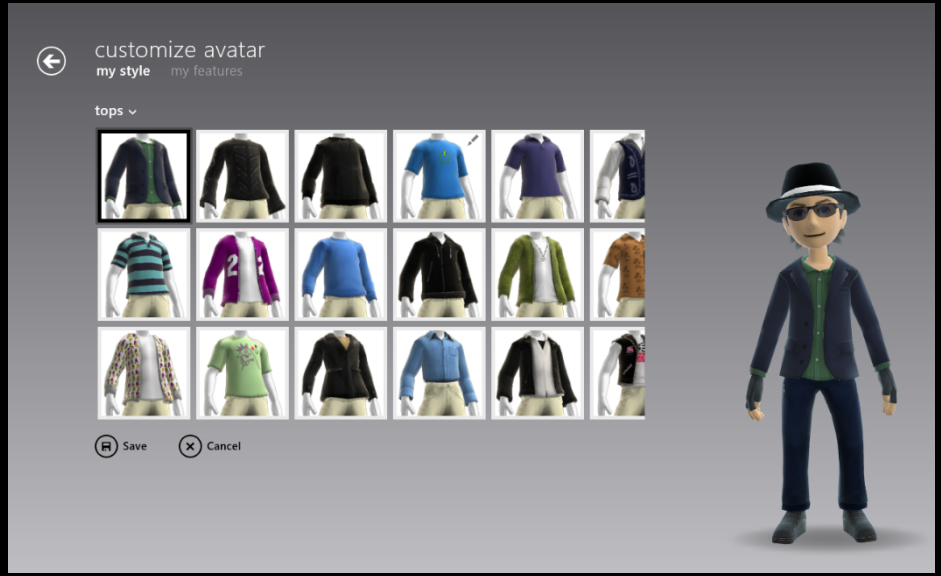
- Fair and efficient workload placement
- Adhering to a set of constraints
- Quickly (and deterministically) dispatching jobs
- Robust and tolerates errors

Scheduling Work

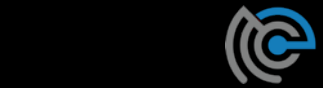
- Containers like…
  - Docker
  - Mesos Unified Containerizer
  - rkt (CoreOS)
- Cluster Manager
- Task placement based on resource
- Operational constraints

Custom Scheduling

- Many allow creation of own custom Scheduler
- Customization for your application:
  - Run-Time?
  - Availability?
  - Fault Tolerance?
  - Hardware Accel?
  - Location?

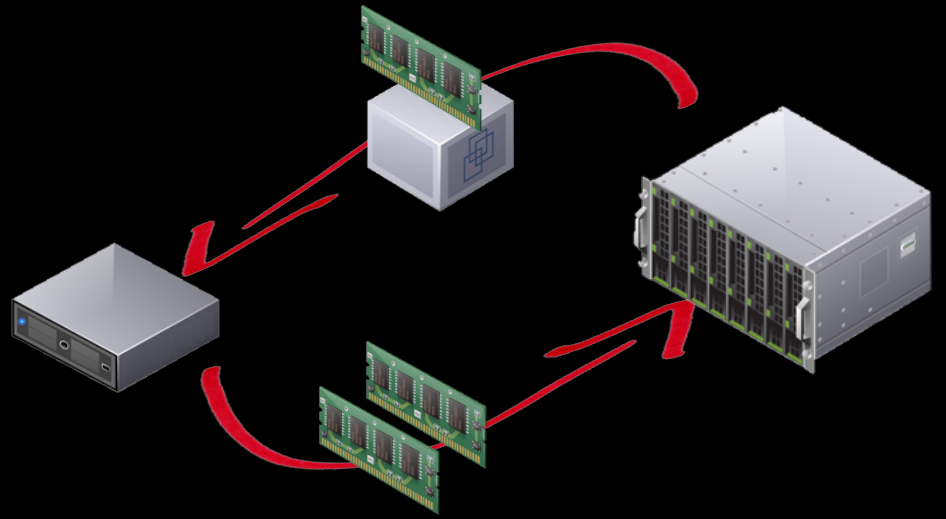


Apache Mesos

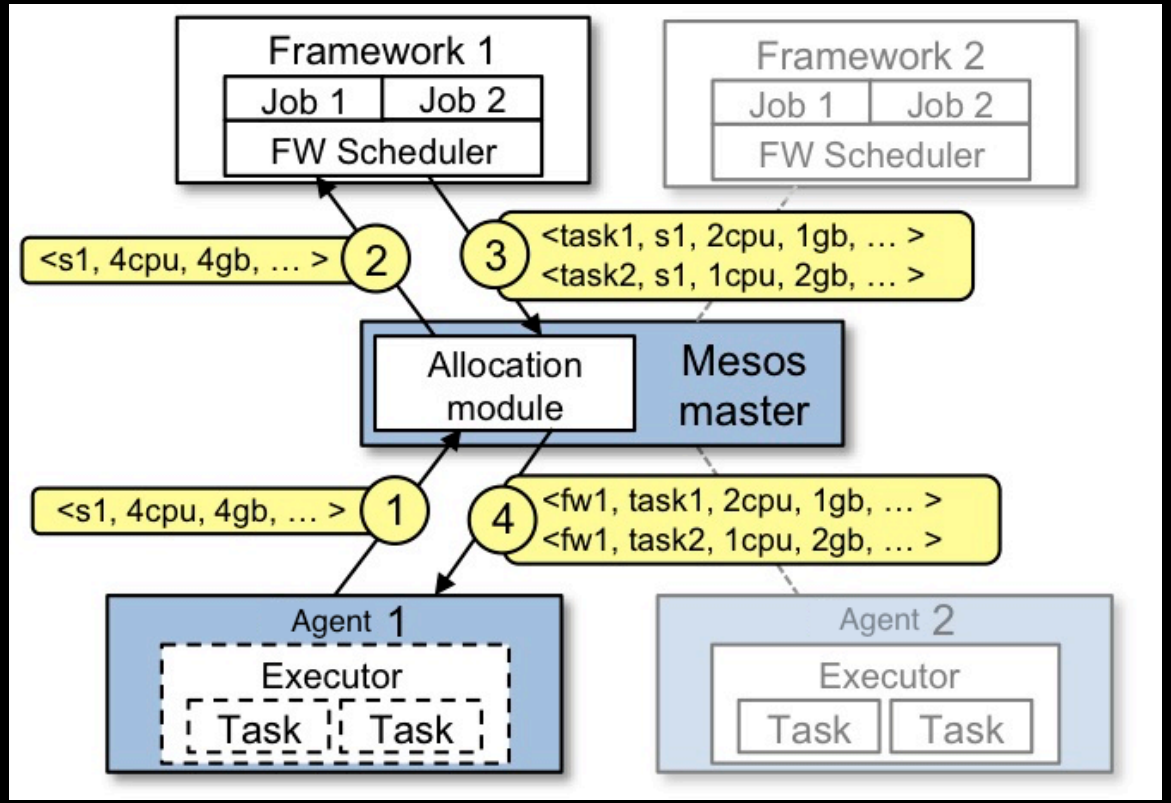


Mesos Frameworks

- Ability to schedule tasks based on Application needs
- Framework implements a Scheduler and Executor
  - Scheduler – Accepts/Denies resources
  - Executor – Application
- Offer / Accept Mechanism
- Multiple Frameworks run within the cluster



Framework / Offer Mechanism



Schedulers and Software-based Storage

Better Together

- Let's create a Software-based Storage Framework
- ScaleIO + Mesos Framework = Awesome Sauce!
- First released in Sept 2016. Now on version 0.3.1
- https://github.com/codedellemc/scaleio-framework

Let’s take a look: ScaleIO

- Software-based Storage Platform
- Scale-out block storage
- Linear performance
- Elastic architecture
- Infrastructure agnostic
- Try ScaleIO. It’s a free download!

ScaleIO

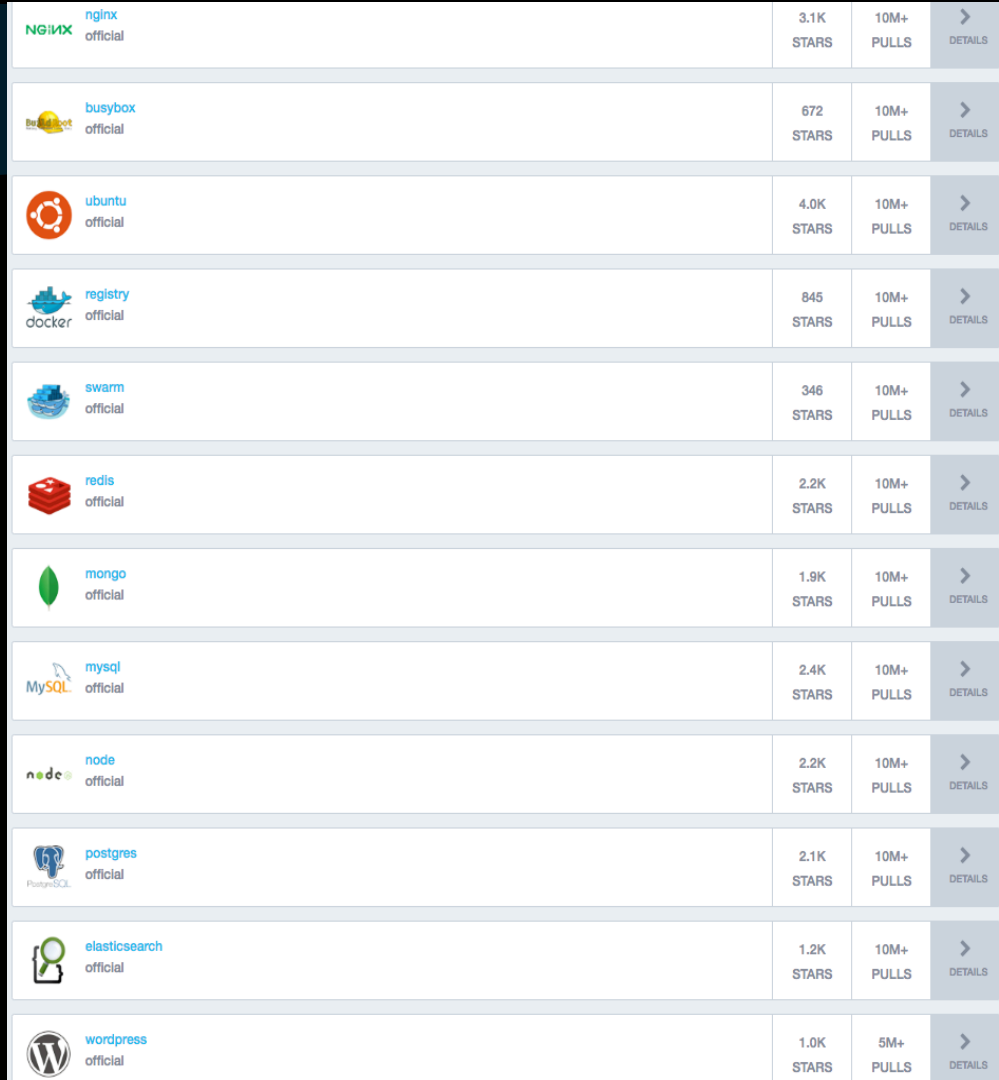
https://www.emc.com/products-solutions/trial-software-download/scaleio.htm

SDS Framework = Mind Blown

- Framework installs and configures Storage Platform on all Scheduler's compute nodes
  - Persistent storage **native** to scheduling platform
  - Globally accessible storage
  - What Storage array? Reduce complexity
  - Deploy Anywhere!

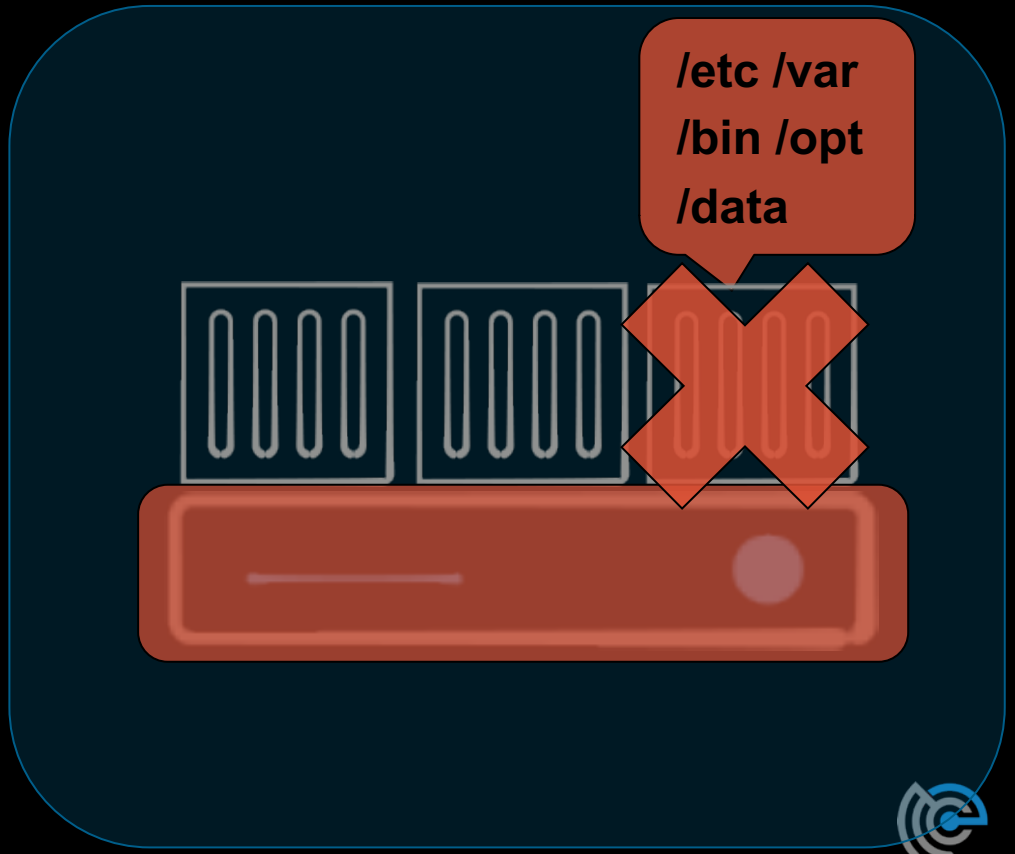
Containers Today

- Many container workloads are long running
- Many have state: user data, configuration, and etc
- Top 7 of 12 Apps in Docker Hub are persistent applications



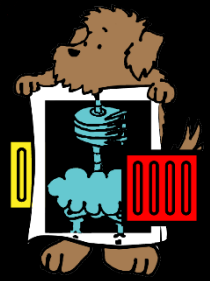
Death of a Container

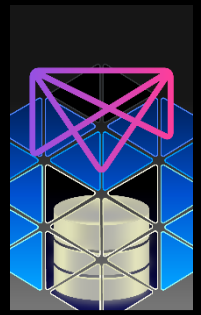
- Where does my data go?
- Turned to the compute node's local disk to store data
- What happens on a node failure?
- Production applications require high availability
- External Storage!



Manages the Storage Enablement

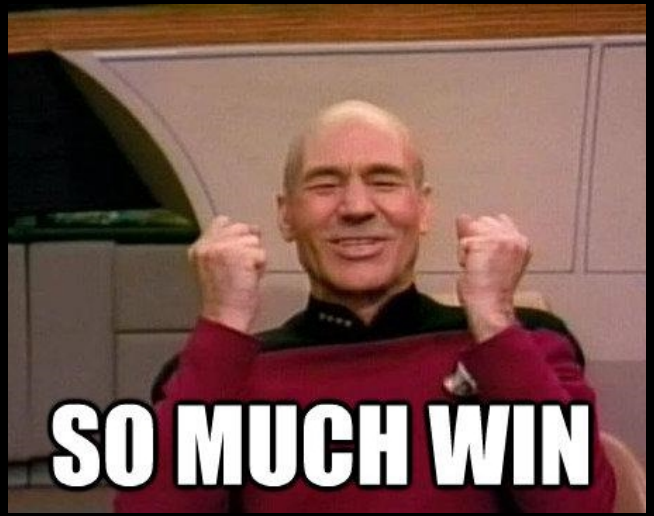
- REX-Ray
  - Vendor agnostic storage orchestration engine
  - AWS, Azure, Ceph, DigitalOcean, GCE, ScaleIO, VirtualBox, many more
  - https://github.com/codedellemc/rexray
- mesos-module-dvdi
  - Hook for Mesos nodes to manage external storage
  - https://github.com/codedellemc/mesos-module-dvdi
  - Contributed back to and is apart of Mesos proper





What this Means for your Apps

- Tolerates node failures
- Highly Available containers and Apps!
- Insulates changes with:
  - container scheduler (APIs, etc)
  - storage platform (workflows, APIs, etc)
- Production ready!



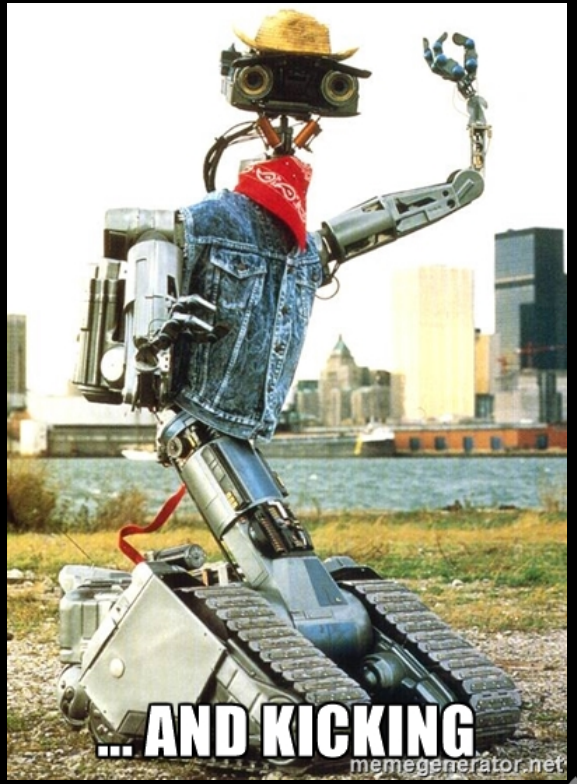
To the Cloud!

Moving towards the Cloud

- Cloud is perfect to enable DevOps
- What makes these cloud accessible?

Self Monitoring Apps

- Framework deploy and configure applications.
- Enable application monitoring via Management APIs
- Determine health and remediate!
- Can fix themselves, but to what end?



Self-aware Applications

- Software-based Storage Platform with a Cloud Platform driven by APIs
  - AWS SDK – 10 Language bindings
- Applications that change their environment
  - Auto-scale Instances
  - Dial in the IOPS for disk
  - Possibilities are endless!
- Self-aware applications! Skynet!

Premise: Self Managing

- Framework can monitor and self remediate Software-based Storage Platform
- The Scenario:
  - ScaleIO has a Storage Pool that is approaching full
  - Identifies the health check warning
  - Creates new EBS volumes in EC2 to expand the Storage Pool

Demo

Configuration

- Mesos Configuration
  - 3 Node Mesos Cluster (Management)
  - 3 Mesos Agent nodes (Compute)
- ScaleIO Cluster (Scale-out storage)
  - Will install on top of 3 Mesos Agent nodes
  - 180 GB local disks on each node to make up this Storage Pool

Configuration (Cont.)

- ScaleIO Framework
  - GitHub: https://github.com/codedellemc/scaleio-framework
- Persistent External Storage
  - Using REX-Ray
    - GitHub: https://github.com/emccode/rexray
  - Using mesos-module-dvdi
    - GitHub: https://github.com/emccode/mesos-module-dvdi

The Moving Parts
